Diabetes and Oral Health

What is Diabetes?
Diabetes is a disease of the pancreas that leads to an elevation of blood sugar. There are two types of diabetes. They are:

Type 1:
- usually occurs in people younger than 30
- no insulin is produced
- this person needs daily insulin injections
- it cannot be prevented.

Type 2:
- not enough insulin is produced or the body cannot use insulin properly
- risk of diabetes increases with age, inactivity and increased body weight
- can be controlled by diet and/or drug intervention and physical activity
- it may be delayed or prevented by a healthy lifestyle.

Is there a link between diabetes and oral health?
It is known that diabetes can damage and affect your eyes, nerves, kidneys, heart and other important systems in the body. People with diabetes have a higher risk of developing gum disease and oral infections.

How does gum disease develop?
When plaque grows along the gum line and is not removed on a daily basis, the gums become red and inflamed. The gums may bleed easily when brushing, flossing or eating. These are signs of gingivitis.

If gingivitis is left untreated, it can develop into periodontal (gum) disease. Periodontal disease affects the gums as well as the surrounding bone.

When plaque builds up along and underneath the gumline and hardens it is called calculus (tartar). When calculus is not removed the gums pull away from the teeth forming “pockets” of infection. This infection leads to bone loss and if enough bone is lost, the tooth can become loose and fall out.

Diabetes causes the blood vessels to thicken, slowing the flow of nutrients and the removal of harmful wastes. This can weaken the resistance of the gum and bone tissue to infection. Daily oral hygiene is essential for anyone diagnosed with type 1 or type 2 diabetes.

What are other mouth problems for people with diabetes?

Thrush - Thrush is a fungal infection that occurs in the mouth. People with diabetes may be more likely to get thrush because a high sugar level in the saliva encourages the fungus to grow. Good diabetic control, no tobacco use (smoking or spit tobacco), daily oral hygiene and removal and cleaning of dentures everyday can help prevent thrush.

Dry Mouth – Dry mouth is often a symptom of undetected and untreated diabetes and can cause an uncomfortable feeling in the mouth.
When there is not enough moisture in the mouth, ulcers, infections, soreness, increased plaque and tooth decay could result. An artificial saliva product may help the mouth feel moist.

**Infections** – Oral infections of any kind can be serious, as they make it difficult to control blood sugar levels. Oral infections may make chewing difficult and painful. This may cause a person with diabetes to select foods that are easier to chew, but not nutritionally acceptable.

**How should people with diabetes care for their teeth and gums?**
Daily brushing and flossing are required to help the mouth stay healthy. Use fluoridated toothpaste and a soft bristled toothbrush. It is important for people with diabetes to preserve their healthy teeth and gums.

**Brushing**
Angle brush towards upper gums. Gently brush back and forth with short vibrating strokes on all sides of your teeth. Remember to brush your tongue. Never share toothbrushes. This spreads disease, including germs that cause tooth decay.

**Flossing**
Wrap floss around middle fingers (use about \( \frac{1}{2} \) meter)

Gently floss between the teeth and under the gums. Move up and down, then move to the next tooth.

**What about denture care?**
People with diabetes may have a lowered resistance to infection and delayed healing. It is important for people wearing dentures to make sure that dentures fit well. If the dentures do not fit well or if your gums are sore, a dental professional should be contacted.

**Protection for teeth and gums**
Good blood sugar control is the best way to prevent gum disease and oral infections.

Regular dental checkups are necessary to find problems early when treatment can be most effective. People with diabetes should have dental checkups every six months or as recommended by their dental professional.
